WALLER BROS.

CONCERNING ARKANSAS STATE CERTIFIED PLANTS:

For the 58th year Waller Brothers are happy to extend a hearty welcome to the strawberry growers of this nation and other lands to let us help you prepare for the coming growing season.

Since 1903 Waller Brothers have gratefully accepted the confidence placed in them by the thousands and thousands who they have served. The only change at Waller Brothers has been our constant effort to keep pace with the proven methods of producing the best in strawberry plants.

WALLER BROTHERS are cooperating with the University of Arkansas and the Arkansas State Plant Board in producing Virus-Free, Disease-Free Certified plants. In the article that follows we will endeavor to explain this plant program to you.

Fortunately, through the cooperation of the University of Arkansas Experiment Station and the Arkansas State Plant Board, a system of plant certification has been developed that insures growers of obtaining plants of the highest quality. Under this system the University maintains REGISTERED (Purple Tag) FOUNDATION STOCK. These plants are free of viruses and other diseases and are released for increase in isolated locations under certification conditions and agreements set up by the Arkansas State Plant Board and the University. BLUE TAG plants are grown from Registered (Purple Tag) stock and are inspected and meet standards of certification set by the State Plant Board. GREEN TAG plants are grown from Blue Tag stock and are inspected and meet standards of certification by the State Plant Board. Under these conditions no Arkansas Certified strawberry plant offered for sale is more than two years from Registered Foundation disease-free plants. In other words, Blue Tag plants are "one year" from Foundation stock, and Green Tag plants are "two years" from Foundation stock.

In addition to being virus-free, Arkansas Certified strawberry plants are free of red stele disease, root-knot nematodes, and noxious weeds. Spring and summer crimp nematodes, leaf spot diseases, and crown borer tolerances are such that the Certified plants are essentially free of these pests.

Our (STATE INSPECTED) Plants have been inspected by a Duly Authorized Inspector of the (PLANT BOARD) and were found to be apparently free of injurious pests and plant diseases.

As you can see this program represents excellent cooperation between several groups who are striving to improve agricultural production. As a result of this coordinated effort purchasers can rely on obtaining high quality strawberry plants when buying those carrying an "Arkansas Certified" tag.

Whether you plant strawberries for personal or commercial use you may rely on Waller Brothers to give your order for plants the same careful attention that has earned for us the coveted phrase, "The Honest Plant Growers," and a reputation for superior plants and service.

Sincerely,

WALLER BROTHERS

ALBRITTON

ALBRITTON is a mid-season variety, originated in North Carolina and appears to be best adapted in that and adjoining states. Without a doubt ALBRITTON is one of the most perfect of all strawberries. The fruit are so uniform in shape that they look as if they had been carefully graded. The plants make a vigorous growth and are quite productive of very large, bright, firm, high quality berries. Although it is primarily a fresh market berry, fully ripened fruit yield an attractive frozen pack.

ARMORE

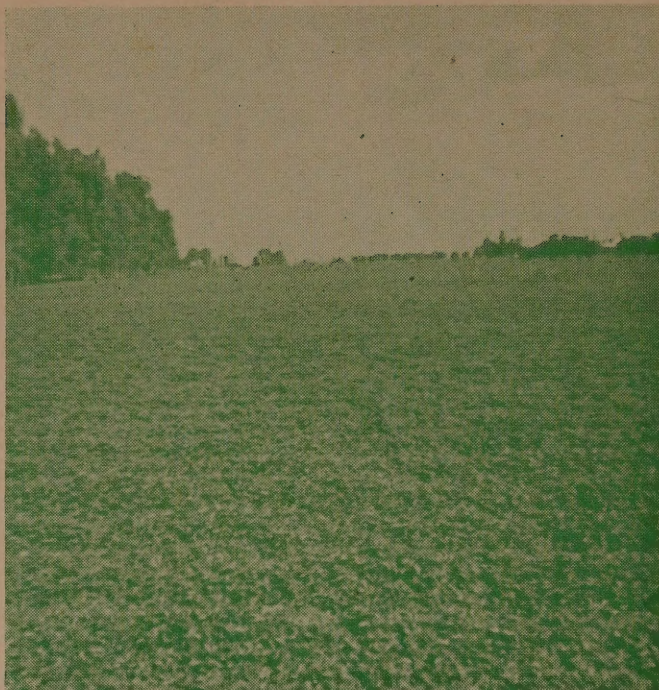

ARMORE is a cross between Aroma and Blakemore, and was introduced in Missouri several years ago. They are very productive of large berries, of good flavor and color. The plants are large, free of diseases and bear over a long season. Fruit ripens a few days later than that of the Blakemore. ARMORE is widely adapted and should be tried in all areas except in extreme north and extreme south. It is generally rated high as a freezing berry as well as having the size and attractiveness for a good fresh market berry.

BELLMAR

This U.S.D.A. introduction is a full sister to Blakemore. This good early variety does well in Missouri, Iowa and other states north of the Blakemore territory. The BELLMAR plant growth is bright glossy green, and the beautiful deep red berries of excellent flavor are among the best for home gardens.

BLAKEMORE

BLAKEMORE is grown on more acres than any other variety, and in some states 90% of the acreage is BLAKEMORE. It is popular in many states because it will stand adverse weather conditions and still make a crop. BLAKEMORE territory reaches into all the southern states and as far north as Pennsylvania and New Jersey, the coastal areas of New England and the southern half of Ohio, Indiana, and Illinois. Fruit is firm bright red, and keeps its color for a long period of time. It is also ideal for long distant shipments and is highly acceptable on any market. In quality BLAKEMORE berries are quite tart, and make excellent preserves and jams. It is a very good freezing berry. In the territory mentioned anyone who wants berries that are easy to grow and sure to grow can do no better than to choose this fine BLAKEMORE variety.

Arkansas Virus Free Certified Blakemore

DIXIELAND

This outstanding variety was released by the U. S. Department of Agriculture in 1954. It has already proven so excellent that it is rapidly expanding into the Blakemore area. It ripens early, about the same time as Blakemore, but has larger fruit with a very vivid, glossy red color. DIXIELAND berries are very firm and are well suited for long shipment. One of the best features of DIXIELAND is its productiveness. It has consistently produced bumper crops in nearly all locations tested. It is vigorous and a good plant maker.

DUNLAP

DUNLAP'S greatest advantage is good growth and production under almost any condition. It is an old garden favorite in many sections of the Northern and Central States. Absolutely one of the very best plant makers, and produces medium, dark red fruit for table purposes.

EARLIDAWN

The ripening of EARLIDAWN is about five days earlier than Blakemore or Premier, which makes it the earliest of them all. It has escaped frost better than many other varieties as its flower stems are short and the flowers are well covered by leaves. The berries average large in size and maintain a good size throughout the picking season. They are glossy, vivid red in color, moderately tough skin, with seeds slightly sunken, with flavor tart and good.

FLORIDA 90

The fine strawberry called FLORIDA 90, originated by Dr. A. N. Brooks in Florida, has already taken over the largest majority of the strawberry acreage in Florida, outshining the Missionary in productiveness and size. The berries of FLORIDA 90 are large, long and pointed, red in color all the way through, large and juicier than the Missionary. They ship well and are recommended to Florida, Texas, and other southern growers who wish to ship to northern markets.

HEADLINER

The HEADLINER, a new variety released by the Louisiana Agricultural Experiment Station was formerly known as selection L-O-188. The bright red color of HEADLINER is attractive for the fresh market. For processing, the variety has proved superior to leading commercial varieties now being grown in the Hammond, La., area. Looks as though this new variety will be fine for our Louisiana customers, and also should have great potentials in other areas.

KLONDYKE

The old standby for shipping to distant markets, adapted to southern planting, berries medium to large, attractive red, flesh very firm, and red to the core. This variety is medium in quality, a good plant maker, and yields good crops.

HISTORY OF THE TREE EVERBEARING BLACKBERRY

(The following description of this unusual plant has been furnished us by the originator.)

This new berry came into our possession as a seedling several years ago. After years of painstaking effort, the undesirable plants have been taken out, now having a variety that comes true and exactly alike.

Due to the nature of their growth and over the long period of ripening, we have named it the TREE EVERBEARING BLACKBERRY. It grows in any soil or climate, has stood twenty degrees below zero without any injury.

Berries are round, very large, extra sweet, yet enough acid for jams and jellies. An excellent keeper, has to be picked only once a week. Plants are very thorny, but berries grow on a long fruit stem in clusters of seven to thirty berries. Ninety percent of the fruit extends above the thorns. There being no berries on the market when they ripen, therefore its possibilities are unlimited as a commercial berry.

Another feature why people prefer it: they grow up off the ground, ninety-five percent are free from dirt regardless of the weather. Rain must be in abundance or it must be planted where it can be watered. The undreamed of feature of this berry is that people in our towns and cities who have been deprived of fresh fruits may now grow all the berries they can use for pies, jams and jellies from six plants in their yard or small garden, taking no more care of them than a common shrub. From a two-year-old plant we have gathered three gallons or 24 pounds. Three-year-old plants have broken all records with a yield of 6 gallons of fruit from one plant.

Waller Brothers do not hesitate to recommend these plants as an excellent berry, as we have fruited some of them for the past several seasons with very satisfactory results.

	3 Plants—\$2.75	12 Plants—\$9.00

Planting Instructions For Tree Everbearing Blackberry Plant

(1) Have soil well prepared. Set plants $1\frac{1}{2}$ to 2 inches deeper than they grew in Nursery. Settle dirt around roots with a little water, keep moist (not wet). Plants come to you pruned, ready for planting. Tops are merely markers, new growth comes from under ground.

(2) For back yard or small garden, plants may be set eight feet apart. For commercial plantings set plants twelve to twenty feet, depending on kind of implements to be used in cultivating.

(3) If your soil needs fertilizer, wait until plants start to grow then apply fertilizer twelve to eighteen inches from plants. We think well rotted barn-yard or chicken litter is the best fertilizer, but if it is not available, use any good commercial fertilizer.

(4) These plants are not supposed to have any berries on them the first summer after planting. They will have a light crop the second summer. Do not be disappointed, the first crop of berries are usually small. First summer's growth will be inclined to grow on the ground, but second year they will come up strong and stand up on their own.

(5) First year's growth will need very little pruning, second year when the canes get tall enough that they start to bend over, cut off ends of canes. This will cause larger and more side branches or limbs. If they get too large they may be cut off at any time of the year without injury to plants.

(6) Cultivate shallow at all times, not over $1\frac{1}{2}$ inches deep, if there are any sprouts come up around your plants, keep plowed or cut off below ground.

THORNLESS BOYSENBERRY

The greatest vine berry ever introduced for nearby markets. The berries are extremely large, many of which are more than two inches long and over one inch in diameter. It comes into bearing the next year after planting and one planting lasts for many years. The

fruiting season is longer than any other vine berry and it is not unusual to pick 15 to 20 pint boxes per plant the second year. Vines are free of thorns which means much in handling. Grow this wonderful berry for a real treat.

(POST PAID):	12 Plants—\$2.00	25 Plants—\$3.75
(NOT POST PAID):	50 Plants—\$5.50	100 Plants—\$10.00 500 Plants—\$35.00

PLANTING AND CULTURE OF THE VINE BERRY

The best time to set out plants is as early in the spring as the ground is workable. Plants should be set in rows 8 or 9 feet each way.

Planting Promptly: Plants should be set as soon as received. If they appear dry when received, place in water to soak for a few minutes. If ground is not ready, hill them in furrows; shelter from sun until ground is ready for plants.

Fertilizing: If the soil is deficient in humus and plant food, barnyard manure can advantageously be applied before the initial plowing and then thoroughly worked into the soil before the plants are set out. Do not put any fertilizer under the hill when planting, as that will tend to burn them. However; owing to the heavy cane growth and abundant fruiting of these berries, they should be fertilized to provide the plant

food necessary, preferably in late fall or early spring.

Trellising: The canes should be put on wires just before the buds begin opening in the spring. First wire should be 30 inches off ground and second year you should add another wire some 15 inches above the first. You should do this for the reason of a much heavier growth of vines for the second year.

Pruning: Each spring new canes will start growing for the bearing of the following year's crop. We advise the removing of these canes when they are 12 inches to two feet in height. In other words, raising one crop at a time, first the berry crop, and then the cane crop for the next year's bearing. Then, when the berry crop is finished and the canes that have been bearing are cut off, the new canes are allowed to grow on the ground as the first summer.

KLONMORE

KLONMORE is a cross between Blakemore and Klondyke. In vigor of plant growth it equals either of its free growing parents. In productiveness KLONMORE is better than Klondyke, almost equal to Blakemore. In areas adapted to this variety the berries are about equal in size to either Blakemore or Klondyke. KLONMORE territory is more limited, being successfully grown in coastal areas of the gulf states and the Atlantic coast states and as far north as South Carolina.

MISSIONARY

For many years MISSIONARY has been a popular berry in Florida and other southern states. In Florida it is now sharing honors with the Florida 90. MISSIONARY will do well on almost all soils, but will do better than most on lighter soil types. The berries ripen early, are medium in size, dark red in color, rather tart quality and attractive in appearance. It is a good shipper and is a favorite with the "cold pack" or "juice" men.

A Field of Pocahontas

POCAHONTAS

An exceptionally fine variety introduced by the U.S.D.A. in 1953 which has steadily increased in popularity due to its extremely fine characteristics. They make a vigorous growth of large robust plants and produce runners freely. POCAHONTAS ripens a week later than the Blakemore, and would be considered a mid-season variety. Berries are large, with moderately tart flavor, deep red in color, glossy with tough skin and bright green cap. Its vigor and high yields make POCAHONTAS a favorite in nearly all the area east of the Mississippi. As far south as Georgia and northward to New England it is an excellent variety.

PREMIER

Although it is being replaced to some extent by newer varieties, the fine qualities of PREMIER which have made it a leader for 40 years still keep it a favorite. The berries ripen early and have a light, bright color that is quite attractive. The flavor is fairly good and slightly acid. PREMIER does well over a large territory, chiefly in the middle and northern states. Plants are sturdy and productive, exceptionally frost resistant and survive extremely cold winters.

ROBINSON

The ROBINSON, known as Kardinal King, also Scarlet Beauty, originated in Michigan. It has enthusiastic supporters as far south as Missouri and northern Virginia. The plants grow small but will make a wide bed of plants that grow in most types of soil. The berries are large, blunt pointed, borne on large thick fruit stems, well protected with heavy foliage. ROBINSON has a long fruiting season which is in its favor.

SPARKLE

SPARKLE is an outstanding variety introduced by the New Jersey Experiment Station. SPARKLE make a good growth of strong, vigorous plants which are seldom affected by late frosts. The berries are sweet, high quality, a glossy dark red with sparkle as the name indicates. They run large to medium size and are of the best quality for the fresh market when picked and packed right. It is rated high for freezing. SPARKLE has been acknowledged a leading berry in the northern and middle states.

SURECROP

Judging from fairly widespread tests SURECROP is adapted through all the middle and northern states. The plants are quite productive, standing high in total yield in most of the tests made to date. The berries average large in size, and maintain a good size throughout the picking season. They have a light, bright red color that becomes a rich red but does not turn dark. They are firm with a tough, glossy skin with yellow seed even with the surface. The flavor is tart and good and they have been rated satisfactory for frozen pack.

THE CULTURE OF STRAWBERRY PLANTS

Soil Requirements and Site: Strawberries are one of the easiest of the fruits to grow and there is but one secret method which will assure success. It is simply good land, good cultivation and good sense. Any good garden soil can be expected to produce a satisfactory crop of both plants and fruit; however, the ideal soil for strawberries is a fertile, deep, well drained sandy loam. All the different types of soil are made more suitable by adding organic matter, either in the form of barnyard manure or green manure crops. Organic matter added to the soil increases the waterholding capacity, and moisture is very essential for maximum production.

In regions where late frosts are frequent, much care should be taken in the selection of a site for the plants. A southern slope, being warmer will make for an early start in growth and will cause the plants to bear fruit much earlier, but for that reason is more subject to late frosts. A northern slope will of course be later, but less likely be injured by late frosts. In sections where frosts are not serious hindrances, many fields of low elevation are good locations for strawberries.

Although several crops of berries are grown in succession on the same land with good results, it is not advisable to do this, for the location should be changed every few years if possible. This helps prevent the possibility of various insects harmful to the plants from becoming too numerous.

Preparing the Soil: It is very important that the soil be properly prepared. The land should be plowed in the late winter or spring. If some cover crop has been grown, the soil will work up better if the sod is disced thoroughly before it is plowed. Next a harrow can be used so that a soft level planting bed is formed. The rows can then be marked and the plants set at the distances wanted. If commercial fertilizer is to be used, which is a very wise thing to do, the rows should be run out to a depth of about four inches. After the fertilizer has been distributed the soil is thrown back into the furrow and again leveled off with a drag.

Types of Fertilizer: As for types of fertilizer for the plants, no kind is better than well rotted stable manure or any other similar materials. It is best to apply this just before the land is prepared for setting the plants. Commercial fertilizers give good results and are used by practically all the large growers. The grower should take great care in applying the fertilizer so as to avoid possible injury in applying before setting. It should be plowed into the ground thoroughly and allow to remain in that manner at least a week before setting the plants. Certain types of fertilizer will prove to be very injurious to the plants if not put on with skill. Mixtures containing Nitrate of Soda, Sulfate of Ammonia or Potash Salts will injure the plants and often times kill them if allowed to come into contact with the roots. Any good commercial fertilizer can be expected to increase the yield, but it is unwise to use over 700 pounds per acre.

Time to Set Plants: Early spring is the best time to set strawberries, for even light frosts which do not lift or heave the ground do not injure the plants. In the early spring the buds of the plants are in an inactive state, and the weather is most favorable to their getting a strong rapid start.

Distance to Set Plants: Plants should be set in rows three or four feet apart, or even as much as four and a half if the soil is very fertile. The plants can be set fifteen to thirty inches apart in the row, depending on the variety, the conditions of the land, earliness of setting and the quality of the plants used.

Methods of setting Plants: A trowl, spade or hoe are the tools most often used in setting plants, and a good job can be done with them. It is important to have the roots straight down. Spreading them might help a little but not much. The crown must be held just at the surface of the ground so that when the soil is packed back against the roots with the hand or foot, the buds will not be covered nor the roots exposed.

Cutting Blossoms: Fruit stems usually appear on strawberry plants soon after they are set in the field. These blossoms should be removed as the production of fruit is a severe strain on their vitality. This aids the plants in overcoming unfavorable conditions and in starting growth and producing runners.

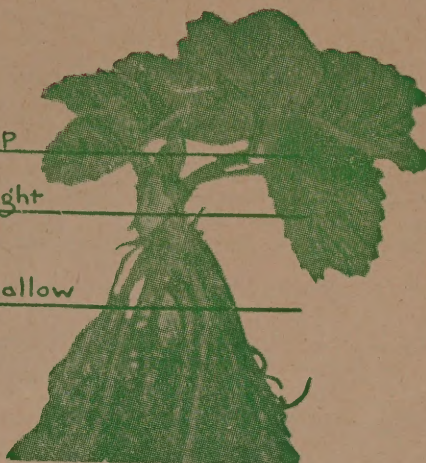

Cultivation: The plants should be cultivated and hoed soon after they have started growth after being set out. It is important at the first hoeing to uncover the buds of any plants that may have been planted too deep. If this is not done early plants will die as a result. Cultivate often enough to keep the surface of the ground from becoming crusted and to keep down grass and weeds. It is not necessary to practice deep cultivation. A depth of one to one and a half inches is deep enough for the hoe, or perhaps slightly deeper with the cultivator. Remember that one cultivation made in time is much more helpful than two made after grass and weeds become bad. Frequent hoeing and plowing make larger, stronger fruiting beds and a better crop of berries.

What to Do When the Plants Arrive: Order your plants early and set plants out upon arrival if possible. If impossible to set upon arrival, place plants in cold storage if available at 32 degrees F. until conditions are right for setting. When no cold storage is available, dig a V-shaped trench, and it is better if the trench is in a moist, shady place. Open the bundles, spread out in thin layers with buds just even with the surface of the ground and firm the soil back against the roots of the plants. If necessary, several layers of plants can be heeled-in the same place with one or two inches of soil between each layer of plants. Wet the soil and roots of plants thoroughly when heeling-in is done. Set as soon as planting conditions are fit.

Too Deep

Just Right

Too Shallow

TENN. BEAUTY

From our experience and reports from our growers, TENNESSEE BEAUTY is the best variety which has come into the strawberry field in several years. It is a cross between the Premier and Missionary. It does well in the southern States, Mid-western, as well as New York, New Jersey, and Pennsylvania. The plants are easily grown, strong and healthy, making a good picking bed. They are a mid-season variety, yield as good as the best and will bring several dollars premium over other varieties. If you are looking for a good mid-season variety, we suggest you try TENN. BEAUTY.

TENN. SHIPPER

TENNESSEE SHIPPER is a Missionary and Blakemore cross, introduced by the Tennessee Experiment Station. It is a very vigorous grower, making larger, stronger individual plants than Blakemore but usually not quite as many. The plants are very productive. The berries ripen early, about with Blakemore, and are very firm. They are so firm that picking may be neglected for several days at a time and still be picked and shipped to market with practically no loss. Tennessee Shipper berries are rather tart and are excellent for freezing.

Everbearing Varieties

GEM

Per 100 — \$3.00 Post Paid

Under most conditions, GEM will make a good bed of plants. The plants are prolific. We have seen the runner plants put out blossoms before they had taken root. The berries are medium to large in size, a bright red color and a very good flavor.

OZARK BEAUTY

A WONDERFUL NEW EVERBEARING
STRAWBERRY

The OZARK BEAUTY is a cross between the 20th Century and the Red Rich, and is proving to be one of the very best everbearing varieties available. It will make more plants than any other everbearer that we have ever grown. Produces fruit of good quality and flavor. Be among the first to try this great new plant — you'll be glad you did.

Close-up of Virus-Free Certified Florida 90's

Guarantee

You are fully protected when you buy WALLER BROTHERS' quality berry plants. We place the following guarantee upon every plant we sell:

1. We guarantee the vitality and purity of our plants to the full amount of purchase price.
2. We guarantee our plants to be double state inspected, disease-free, virus-free.
3. We guarantee our plants to pass inspection by any duly authorized state or federal inspector.
4. We guarantee the safe delivery of our plants to any destination in the United States.
5. We guarantee you full and complete satisfaction or your money refunded.

However, as yield is controlled to some extent by soil, weather conditions and method of cultivation, under no conditions shall WALLER BROTHERS be held liable for production, nor in any case shall we be liable for more than the original cost of the plants.

Instructions

All quotations, acceptances of orders, promises of shipment are subject to change, limitations or cancellations made necessary by seasonal conditions, state, government regulations or other hazards beyond our control.

WHEN TO ORDER: Your order may be placed at any time during the year for delivery any time between November 1 and April 20. No order will be shipped before November 1 and orders shipped after April 20 will be at purchaser's risk. **LATE IN THE SEASON WE MAY BE OUT OF SOME VARIETIES, BUT IF YOU ORDER EARLY, PLANTS WILL BE RESERVED UNTIL YOU ARE READY FOR THEM. BE SURE TO ORDER EARLY.**

CASH in full must accompany your order. You may remit by Money Order, Bank Draft, or Cash in Registered Letter.

PACKING: We pack all plants according to the most approved scientific methods, and we make no extra charge for this packing.

REFERENCE: Dunn and Bradstreet, Farmers and Merchants Bank, Judsonia, or any Waller Bros. Customer.

Everbearing Varieties

RED RICH

RED RICH is still one of the most delicious of all everbearers. Its beauty and fine quality make it ideal for the home garden. The berries are large and make a fine frozen product. RED RICH generally does not make many runner plants. Thus, it is well suited for use in berry terraces or in any type of hill system. RED RICH should be planted in good, fertile soil and receive extra water during dry weather.

(Prices Are Post Paid)

STREAMLINER

Per 100 — \$3.00 Post Paid

Now that virus-free STREAMLINER is available we believe that you will surely want some of these excellent everbearers. It is a good plant maker and produces large, solid-red berries that have a delicious flavor. It seems that STREAMLINER is a very promising everbearer for the central and eastern states.

SUPERFECTION

Per 100 — \$3.50 Post Paid

SUPERFECTION is a good dependable everbearer. It is a vigorous grower and readily produces good fruiting rows. This variety is also known as Gem and Brilliant. The berries are large and quite attractive. The color is light red and the flavor ranges from mild to tart.
